

CoreGuard Integration Delivery

The completed integration is recorded in local Git commit `a88237d71a2bb6c91c58c02a1510a2b49493622b` (feat: add network defense lab and Cobra CLI). It is rebased cleanly onto the current remote `main` commit `561fba40274833cd3e49dda2ffd174ed77d138ec` , preserving the repository's concurrent forensic documentation and source changes.

Included work

Area	Delivered change
Android project	Reconstructed buildable Kotlin/AndroidX project with Gradle wrapper and API 35 configuration.
Network Defense Lab	Native 16-node interactive topology with live BFS/DFS attacks, direct and cascade defenses, rollback, metrics, event logging, and Prim-style MST visualization.
Accessibility	<code>ColorVisionType.PROTANOPIA</code> , an Okabe–Ito-derived palette, and shape markers so status does not depend on color alone.
CoreGuard CLI	Cobra-based Go companion with <code>status</code> , <code>simulate</code> , and <code>topology</code> commands, JSON output, BFS/DFS modes, defenses, event output, and MST guidance.
Tests	Simulation-engine and command-level Go tests, race detection, vetting, Android unit-test task, APK assembly, and Android lint.
Documentation	Unified README preserving upstream forensic, third-party provenance, package, and Apache-2.0 notes.
Safety	Supplied <code>uv.exe</code> was identified passively and never run or bundled. The Cobra source archive was not copied; Cobra is a versioned Go dependency.

Expo limitation: The React Native/Expo project shown in the tRPC error screenshot is not present in the connected repository. The missing tRPC context therefore cannot be

repaired in this source tree. The README states this limitation explicitly.

Validation

Check	Result
<code>go test -race ./...</code>	Passed.
<code>go vet ./...</code>	Passed.
CLI build	Passed; Linux AMD64 binary generated.
<code>testDebugUnitTest assembleDebug lintDebug</code>	Passed.
Android lint	No issues found.
Debug APK	Generated and signed with the debug signing configuration.
Working tree	Clean after rebase and validation.

Delivery artifacts

File	Purpose
<code>CoreGuard-debug-a88237d.apk</code>	Installable Android debug build.
<code>coreguard-cli-linux-amd64-a88237d</code>	Built Linux AMD64 CLI.
<code>coreguard-source-a88237d.zip</code>	Source snapshot for the completed commit.
<code>coreguard-integration-a88237d.bundle</code>	Full Git bundle containing <code>main</code> and commit history for import or push.
<code>SHA256SUMS.txt</code>	Integrity checksums for all four artifacts.

Remote publication status

The connected GitHub authorization can read the repository but cannot write Git objects or update contents. Both standard Git transport and GitHub's Git Data API returned **HTTP 403: Resource not accessible by integration**. The remote branch was not modified, and no force push was attempted.

After repository-content write permission is enabled, the bundle can be imported and pushed as a normal fast-forward update because its parent is the current remote `main` commit.
